## European Technical Assessment ETA-11/0478 of 2018/06/12

### I General Part

**Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011: ETA-Danmark A/S**

**Trade name of the construction product:**

Arras Construction Furniture Joist Hangers

**Product family to which the above construction product belongs:**

Three-dimensional nailing plate (Joist hanger for wood to wood connections and wood to concrete or steel connections)

**Manufacturer:**

Arras Construction Furniture OÜ  
Veerme 23  
EE-11625 Tallinn  
Tel. + 372 670 6000  
Fax + 372 670 6405  
Internet [www.arrascf.eu](http://www.arrascf.eu)

**Manufacturing plant:**

Arras Construction Furniture OÜ  
Veerme 23  
EE-11625 Tallinn

**This European Technical Assessment contains:**

35 pages including 3 annexes which form an integral part of the document

**This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of:**

Guideline for European Technical Approval (ETAG) No. 015 Three Dimensional Nailing Plates, April 2013, used as European Assessment Document (EAD).

**This version replaces:**

The ETA with the same number issued on 2016-08-09

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

## II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

### 1 Technical description of product and intended use

#### Technical description of the product

Arras Construction Furniture joist hangers are one-piece non-welded, face-fixed joist hangers to be used in timber to timber connections as well as connections between a timber joist and a concrete structure or a steel member.

The joist hangers are made from pre-galvanized steel DX 51 D / Z 275 according to EN 10346:2015 with minimum yield strength  $R_e \geq 250 \text{ N/mm}^2$ , and minimum tensile strength  $R_m \geq 360 \text{ N/mm}^2$  and minimum ultimate strain  $A_{80} \geq 22\%$ . Dimensions, hole positions, steel type and typical installations are shown in Annex A.

### 2 Specification of the intended use in accordance with the applicable EAD

The joist hangers are intended for use in making end-grain to side-grain connections in load bearing timber structures, as a connection between a wood based joist and a solid timber or wood based header, where requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation (EU) 305/2011 shall be fulfilled.

The joist hangers can be installed as connections between wood based members such as:

- Structural solid timber classified to C14-C40 according to EN 338 / EN 14081,
- Glulam classified to GL24-GL36 according to EN 1194 / EN 14080,
- LVL according to EN 14374,
- Parallam PSL,
- Intrallam LSL,
- Duo- and Triobalken,
- Cross laminated timber,
- I-beams with backer blocks on both sides of the web in the header and web stiffeners in the joist
- Plywood according to EN 636

However, the calculation methods are only allowed for a characteristic wood density of up to  $460 \text{ kg/m}^3$ . Even though the wood based material may have a larger density, this must not be used when calculating the load-carrying capacities of the fasteners.

Annex B states the formulas for the characteristic load-carrying capacities of the joist hanger connections.

The design of the connections shall be in accordance with Eurocode 5 or a similar national Timber Code.

It is assumed that the forces acting on the joist hanger connection are  $F_{up}$ ,  $F_{down}$  and  $F_{lat}$ , as shown in the figure below. The forces  $F_{up}$  and  $F_{down}$  shall act in the middle of the joist hanger. The force  $F_{lat}$  is assumed to act  $e_{1,90}$  above the centre of gravity of the nails in the joist. It is assumed that the forces are acting right at the end of the joist.

It is assumed that the header is prevented from rotating. Similar it is assumed that the concrete structure or the steel member, to which the joist hanger is bolted, does not rotate. If the header beam only has installed a joist hanger on one side, the eccentricity moment  $M_v = F_d \cdot (B_H / 2 + 30\text{mm})$  shall be considered. The same applies when the header has joist hanger connections on both sides, but with vertical forces which differ more than 20%.

It is a condition for a force  $F_{lat}$  perpendicular to the vertical symmetry line that the joist hanger is connected to a wood-based header with nails in all holes (full nailing) or in all holes marked for partial nailing.

The joist hangers are intended for use for connections subject to static or quasi static loading.

The zinc-coated hangers are for use in timber structures subject to dry, internal conditions defined by the service classes 1 and 2 of EN 1995-1-1:2010, (Eurocode 5).

The scope of the joist hangers regarding resistance to corrosion shall be defined according to national provisions that apply at the installation site considering environmental conditions.

The provisions made in this European Technical Assessment are based on an assumed intended working life of the joist hangers of 50 years.

The indications given on the working life cannot be interpreted as a guarantee given by the producer or Assessment Body, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

### 3 Performance of the product and references to the methods used for its assessment

Characteristic	Assessment of characteristic
<b>3.1 Mechanical resistance and stability*) (BWR1)</b>	
Characteristic load-carrying capacity	See Annex B
Stiffness	No performance assessed
Ductility in cyclic testing	No performance assessed
<b>3.2 Safety in case of fire (BWR2)</b>	
Reaction to fire	The joist hangers are made from steel classified as <b>Euroclass A1</b> in accordance with EN 13501-1 and European Commission Delegated Regulation 2016/364 of 1 July 2015
<b>3.3 Hygiene, health and the environment (BWR3)</b>	
Influence on air quality	The product does not contain/release dangerous substances specified in TR 034, dated March 2012 0**)
<b>3.7 Sustainable use of natural resources (BWR7)</b>	
	No Performance Determined
<b>3.8 General aspects related to the performance of the product</b>	
	The joist hangers have been assessed as having satisfactory durability and serviceability when used in timber structures using the timber species described in Eurocode 5 and subject to the conditions defined by service class 1 and 2
Identification	See Annex A

\*) See additional information in section 3.9 – 3.12.

\*\*) In addition to the specific clauses relating to dangerous substances contained in this European technical Assessment, there may be other requirements applicable to the products falling within its scope (e.g. transposed European legislation and national laws, regulations and administrative provisions). In order to meet the provisions of the Construction Products Regulation, these requirements need also to be complied with, when and where they apply.

### 3.9 Methods of verification

See annex B for characteristic load-carrying capacities of the joist hangers.

The characteristic capacities of the joist hangers are determined by calculation assisted by testing as described in the EOTA Guideline 015 clause 5.1.2. They should be used for designs in accordance with Eurocode 5 or a similar national Timber Code.

The design models allow the use of fasteners described in the table on page 19 in Annex A:

*Threaded nails (ringed shank nails) in accordance to EN 14592*

In the formulas in Annex B the capacities for threaded nails calculated according to Eurocode 5 are used assuming a thick steel plate when calculating the lateral nail load-carrying-capacity for joist hangers 2,0 mm.

Further, the joist hangers may be fastened to a concrete structure or steel member by bolts with a diameter of 10 mm in holes with a diameter of 11 mm and by bolts with a diameter of 12 mm in holes with a diameter of 13 mm.

No performance has been determined in relation to ductility of a joint under cyclic testing. The contribution to the performance of structures in seismic zones, therefore, has not been assessed.

No performance has been determined in relation to the joint's stiffness properties - to be used for the analysis of the serviceability limit state

### 3.10 Aspects related to the performance of the product

#### 3.11.1 Corrosion protection in service class 1 and 2.

In accordance with ETAG 015 the joist hangers have a zinc coating weight of min Z275. The steel employed is DX51D + Z (min Z275) according to EN 10346:2015 with a minimum yield strength  $R_e$  of 290 MPa, a minimum tensile strength  $R_m$  of 360 MPa and a minimum ultimate strain  $A_{80}$  of 22 %.

### 3.11 General aspects related to the fitness for use of the product

#### Joist hanger connections

A joist hanger connection in this ETA are assessed provided:

#### Header – support conditions

- The header shall be restrained against rotation and

be free from wane under the joist hanger.

If the header carries joists only on one side, the eccentricity moment from the joists  $M_{ec} = R_{joist} (b_{header}/2 + e_{nail})$  shall be considered at the strength verification of the header.

$R_{joist}$  Reaction force from the joists,

$b_{header}$  Width of header,

$e_{nail}$  Distance from nails in the joist to the surface of the header.

- For a header with joists from both sides but with different reaction forces a similar consideration applies.

### Wood to wood connections

- Joist hangers may be fastened to wood-based members by nails.
- There shall be nails in all holes or a partial nailing pattern as prescribed in Annex B-C may be used.
- The characteristic capacity of the joist hanger connection is calculated according to the manufacturer's technical documentation, dated 2011-05-20.
- The joist hanger connection is designed in accordance with Eurocode 5 or an appropriate national code.
- The gap between the end of the joist and the surface, where contact stresses can occur during loading shall be limited. This means that for joist hangers with outward flaps the gap between the surface of the end of the joist and that of the header shall be maximum 3 mm.

Joist hangers with inward flaps the gap between the surface of the nail heads in the inward flaps and the end of the joist shall be maximum 8 mm.

- For Arras Construction Furniture joist hangers with overlapping nails in the joist (see figure 8.5 in EN 1995-1-1) the width of the joist shall be at least  $l+4d$ , where  $l$  is the length of the nails and  $d$  is the diameter of the nails in the joist. For joist hangers with staggered nails in the joist the width shall be at least the penetration length of the nails.
- The cross section of the joist at the joist hanger connection shall have sharp edges at the lower side against the bottom plate, i.e. it shall be without wane.
- The cross section of the header shall have a plane surface against the whole joist hanger.

- The width  $B_J$  of the joist shall correspond to that of the joist hanger.  $B_J$  shall not be smaller than  $B-3$  mm, where  $B$  is the inner width of the joist hanger.
- The depth of the joist shall be so large that the top of the joist is at least 20 mm above the upper fastener in the joist.
- Nails to be used shall have a diameter, which fit the holes of the joist hangers. Nails shall have a diameter which is not smaller than the diameter of the hole minus 1 mm.

#### **Wood to concrete or steel**

The above mentioned rules for wood to wood connections are applicable also for the connection between the joist and the joist hanger.

- The joist hanger shall be in close contact with the concrete or steel over the whole face. There shall be no intermediate layers in between.
- The gap between the end of the joist and the surface, where contact stresses can occur during loading shall be limited. This means that the gap between the surface of the end of the joist and that of the concrete or steel shall not exceed 3 mm.
- The bolt shall have a diameter not less than the hole diameter minus 2 mm.
- The bolts shall be placed symmetrically about the vertical symmetry line. There shall always be bolts in the 2 upper holes.
- The upper bolts shall have washers according to EN ISO 7094.

## **4 Attestation and verification of constancy of performance (AVCP)**

### **4.1 AVCP system**

According to the decision 97/638/EC of the European Commission<sup>1</sup>, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 2+.

## **5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD**

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark prior to CE marking.

Issued in Copenhagen on 2018-06-12 by

Thomas Braun  
Managing Director, ETA-Danmark

### Annex A Product details and definitions

**Joist hanger with Blank 238:** Face mount hanger with external flanges with and without hook  
2,0 mm thick pre-galvanised steel DX51D + Z (min Z275) according to EN 10346:2009 with a minimum  $R_e$  of 290 MPa, a minimum tensile strength  $R_m$  of 360 MPa and a minimum ultimate strain  $A_{80}$  of 22 % with tolerances according to EN 10143:1993.

Table A1:

Blank	Total n° of holes		Width interval		Height interval

10.0, 12.0	Max. 2 mm. larger than the bolt diameter	See specification of the manufacturer

## Annex B

### Characteristic load-carrying-capacities

#### Characteristic capacities of the joist hanger connections with nails

The downward and the upward directed forces are assumed to act in the middle of the joist. The lateral force is assumed to act at a distance  $e_{J,90}$  above the centre of gravity of the nails in the joist.

Two nail patterns are specified. A full nailing pattern, where there are nails in all the holes, and a partial nailing pattern, where the number of nails in the joist and the header are at least half the numbers specified for full nailing. The nails in the joist may be staggered and there shall always be a nail in the upper and the lower holes. The other nails are distributed evenly over the height. The nails in the header shall be put in the holes closest to the bend line.

For joist hangers with overlapping nails in the joist (see figure 8.5 in EN 1995-1-1) the width of the joist shall be at least  $l+4d$ , where  $l$  is the length of the nails and  $d$  is the diameter of the nails in the joist. For joist hangers with staggered nails in the joist the width shall be at least the penetration length of the nails.

#### B.1 Joist hangers fastened with nails

**Force downward toward the bottom plate:**

$$F_{Z,Rk} = \min \left\{ \frac{(n_J + 2) \cdot F_{v,J,Rk}}{1}, \sqrt{\left( \frac{1}{n_H \cdot F_{v,H,Rk}} \right)^2 + \left( \frac{1}{k_{H,1} \cdot F_{ax,H,Rk}} \right)^2} \right\} \quad (B.1.1)$$

**Force upward away from the bottom plate:**

$$F_{Z,Rk} = \min \left\{ \frac{n_J \cdot F_{v,J,Rk}}{1}, \sqrt{\left( \frac{1}{n_H \cdot F_{v,H,Rk}} \right)^2 + \left( \frac{1}{k_{H,2} \cdot F_{ax,H,Rk}} \right)^2} \right\} \quad (B.1.2)$$

**Lateral force**

$$F_{Y,Rk} = \min \left\{ \frac{n_J \cdot F_{v,J,Rk}}{\sqrt{\left( \frac{2 \cdot \sqrt{e_{J,0}^2 + e_{J,90}^2}}{B} \right)^2 + \left( \frac{F_{v,J,Rk}}{F_{ax,J,Rk}} \right)^2}}, \frac{F_{v,H,Rk}}{\sqrt{\left( \frac{1}{n_H} + \frac{e_H}{e_1} \right)^2 + \left( \frac{e_H}{e_2} \right)^2}} \right\} \quad (B.1.3)$$

$n_J$  total number of nails in both sides of the joist

$n_H$  total number of nails in the side of the header

$F_{v,Rk}$  characteristic lateral load-carrying capacity of a nail in the joist or in the header indicated by the indices J or H in N, for 2,0 mm or 2,5 mm steel plates, the Eurocode 5 equations for thick steel plates may be applied

$F_{ax,Rk}$  characteristic axial load-carrying capacity of a nail in the joist or in the header indicated by the indices J or H in N

$B$  width of the joist hanger in mm, see figure B1

$e_{J,90}$  distance of the lateral force above the centre of gravity of the nails in the joist in mm, see Tables B1 to B12.  $e_{J,90}$  must not be taken less than 0,2 times the depth of the joist hanger

$e_{J,0}$  joist hanger dimension in mm, see Tables B1 to B12

- $e_1$  joist hanger dimension in mm, see Tables B1 to B12
- $e_2$  joist hanger dimension in mm, see Tables B1 to B12
- $k_{H,1}$  form factor, see Tables B1 to B12
- $k_{H,2}$  form factor, see Tables B1 to B12

Figure B1: Definition of  $e_{J,90}$  and  $e_{J,0}$

### Combined forces

In case of combined forces the relevant of the following inequalities shall be fulfilled:

Downward force: 
$$\left( \frac{F_{\text{Down,Ed}}}{F_{\text{Down,Rk}}} \right)^2 + \left( \frac{F_{\text{lat,Ed}}}{F_{\text{lat,Rk}}} \right)^2 \leq 1,0 \quad (\text{B.1.4})$$

Upward force: 
$$\left( \frac{F_{\text{Up,Ed}}}{F_{\text{Up,Rk}}} \right)^2 + \left( \frac{F_{\text{lat,Ed}}}{F_{\text{lat,Rk}}} \right)^2 \leq 1,0 \quad (\text{B.1.5})$$

Table B1: Joist hanger Blank 238 with external flanges: Form factors  $k_{H,1}$  and  $k_{H,2}$  and dimensions  $e_1$  and  $e_2$ ;  $e_{J,0} = 30$  mm

## B.2 Characteristic load-carrying-capacities of the joist hanger connections with bolts

For joist hangers connected to a wall of concrete, lightweight concrete or to a steel member the assumptions for the calculation of the load-carrying capacity of the connection are:

- The force transfer from the joist to the joist hanger is as for a wood-wood connection, see clause B.1.
- The bolts shall always be positioned symmetrically about the vertical axis of the joist hanger.
- Washers according to EN ISO 7094 shall be installed under the bolt heads or nuts.

### Description of the static model

For a downward directed force toward the bottom plate the static behaviour is basically the same as for a wood-wood connection with nails.

The fasteners in the joist are subjected to a lateral force, which is equally distributed over the nails in the joist.

Since the concrete and steel have a larger compressive strength than timber subjected perpendicular to the grain the rotation point may be assumed positioned at the top of the bottom plate.

Figure B2 Left: Cross section in joist. Right: The joist will deflect and rotate, at the bottom a contact force will occur at the bottom plate, and the withdrawal forces in the bolts in the wall will vary linearly as assumed for a nailed connection in the header.

The forces in the bolts will be partly lateral forces, partly withdrawal forces. The lateral forces are distributed evenly over all bolts. The withdrawal forces are on the safe side assumed to be taken by the 2 upper bolts with washers. The maximum withdrawal force in a upper bolt can be calculated from

$$F_{ax,bolt} = \frac{F \cdot e}{2 \cdot z_{max}} \quad (B.2.1)$$

Where

$F$  downward directed force toward the bottom plate

$e$  eccentricity = distance from the nail column in the joist to the surface of the header.

$z_{max}$  max distance from upper bolt to the bottom plate (rotation point)

The upper 2 bolts are critical. They are subjected to a lateral force and a withdrawal force. The lateral force is determined assuming an even distribution of the downward force  $F$ .

$$F_{\text{lat,bolt}} = F_{Z,\text{Ed}} / n_{\text{bolt}} \quad (\text{B.2.2})$$

### Characteristic capacities of a bolted joist hanger connection

The characteristic capacity of the nail connection between the joist and the joist hanger can be calculated from the same assumptions and formulas as for joist hangers nailed to a wooden header.

$$F_{Z,\text{J,Rk}} = (n_{\text{J}} + 2) \cdot F_{v,\text{J,Rk}} \quad (\text{B.2.3})$$

The upper 2 bolts are critical. They are subjected to a lateral force calculated from formula (B.2.2).

The withdrawal force in an upper bolt is calculated from (B.2.1).

Where

$F_{Z,\text{Ed}}$  downward directed force toward the bottom plate

$n_{\text{bolt}}$  total number of bolts in the joist hanger

$e$  eccentricity = distance from the nail column in the joist to the surface of the header

$z_{\text{max}}$  max distance from the upper bolt to the bottom plate (rotation point)

It shall be verified by the design of the bolted connection that the upper bolts have sufficient load-carrying design capacity to carry the combined lateral and axial forces.

From the characteristic capacity of the bearing resistance between the bolt and the plate of the joist hanger the following maximum characteristic capacity of the joist hanger connection can be determined.

$$F_{\text{bear,Rk}} = n_{\text{bolt}} \cdot f_{u,k} \cdot d \cdot t \quad (\text{B.2.4})$$

Where

$n_{\text{bolt}}$  total number of bolts in the 2 flaps

$f_{u,k}$  characteristic ultimate tensile strength of the steel, 360 MPa

$d$  diameter of the bolt

$t$  thickness of the steel plate of the joist hanger

The characteristic load-carrying capacity of the joist hanger connection is the minimum of:

- The capacity determined from (B.2.3) from the nails in the joist
- The capacity determined from (B.2.4) from the embedding strength of the steel plate against the bolt
- The capacity controlled by the bolt forces given by (B.2.1) and (B.2.2).

### Annex C Installation of joist hangers

#### Joist hanger in wood/wood connection

**Joist hanger connected to concrete, lightweight concrete  
or a steel member by bolts**
